CHAPTER-1 BINARY SYSTEM

Base Conversion

A number a_n , a_{n-1} ... a_2 , a_1 , a_0 , a_{-1} , a_{-2} , a_{-3} ... expressed in a base r system has coefficient multiplied by powers of r.

Key Points:

To convert a number of base r to decimal is done by expanding the number in a power series as in (A) Then add all the terms.

Example : Convert following Binary number (11010.11)₂ in to decimal number.

Solution: Base $r = 2$

 $1 \times 2^4 + 1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 0 \times 2^0 + 1 \times 2^{-1} + 1 \times 2^{-2}$

 $(11010.11)₂ = (26.75)₁₀$

Example : Convert (127.4)₈ in to decimal equivalent.

Solution: $1 \times 8^2 + 2 \times 8^1 + 7 \times 8^0 + 4 \times 8^{-1} = (87.5)_{10}$

Numbers with Different bases:

Example: Convert following hexadecimal number into decimal number**:** (B65F) ¹⁶ **Solution: Solution:**
 $11 \times 16^3 + 6 \times 16^2 + 5 \times 16^1 + 15 \times 16^0 = (46687)_{10}$

Conversion of decimal number to a number in base r:

- Separate the number into an integer part and fraction part.
- **EXECUTE:** Divide the number and all successive quotients by r and accumulating the remainders.
- Conversion of decimal fraction is done by multiplying the fraction and all successive fractions by r and

integers are accumulated.

Example: Convert decimal number 41 to binary.

Solution:

Thus $(153)_{10} \rightarrow (231)_8$

Example: Convert $(0.6875)_{10}$ to Binary.

Solution: 0.6875 is multiplied by 2 to give an integer and a fraction. The new fraction is multiplied by 2 to give a new integer and new fraction.

This process is continuing until the fraction becomes zero or until the numbers of digits have sufficient accuracy.

Conversion from binary to octal is easily done by partitioning the binary number into groups of 3 digits each starting from binary point & proceeding to left and to the right.

The corresponding octal digit is then assigned to each group.

For conversion into hexadecimal, binary number is divided into group of 4 digits.

Example :

 $(2 6 1 5 3.74 6 0)$ ₈ to binary number 010 110 001 101 011 111 100 110 000

Thus binary number is

(10 110 001 101 011.11110011)2

Example: Convert binary to hexadecimal number**:**

(10 1100 0110 1011.1111 0010)²

0010 1100 0110 1011. 1111 0010

2 C 6 B F $2 = (2C6B.F2)_{16}$

Example :(673.124)₈ to binary number:

 $(673.124)_{8} \equiv (110\ 111\ 011 \cdot 001\ 010\ 100)_{2}$

6 7 3 1 2 4

(306.D) ¹⁶ to binary number**:**

 $(306.D)_{16} \equiv (0011\ 0000\ 0110. \ 1101)_2$

3 0 6 D

Complements

Complements are used in digital computer for simplifying the subtraction operations and for logic manipulation. There are 2 types of complements for each base r system

i. Diminished radix complement $((r - 1)$'s complement

ii. Radix complements (r's complement)

- i. Diminished radix complement**:**
	- Given a number N in base r having n digits, the $(r-1)$'s complement of N is defined as $(r^{n}-1) N$.
	- For decimal number $r = 10$, $(r 1)$'s complement or 9's complement of N is $(10^n 1) N$.

9's complement: $(10^n - 1) - N$:

- \bullet 10ⁿ can be represented as single 1 followed by n 0's
- $10^n 1$ is number represented by n 9's.
- Thus 9's complement can be obtained by subtracting each digit of number N by n 9's.

Example : Find 9's complement of 546700

Solution:

 $999999 - 546700 = 453299$

9's complement of 546700 is 453299

1's Complement for binary number:

- It is given as $(2^n 1) N$
- 2^n can be representing as binary number consist of single 1 followed by n 0's.
- $2^n 1$ can be represented as n 1's.

Example :1's complement of 1011000.

Solution: $1111111 - 1011000 = 0100111$

Note: It is similar to changing 1's to 0's and 0's to 1 or complement each digit of number is similar to taking 1's complement of the number.

Note: $(r - 1)$'s complement of octal and hexadecimal number is obtained by subtracting each digit from 7 and F respectively.

(ii) Radix Complement:

r's complement of n digit number N in base r is defined as $r^{n} - N$ for $N \neq 0$ & 0 for $N = 0$

It is equivalent to adding 1 to $(r-1)$'s complement.

If $(r-1)$'s complement is given, r's complement can be obtained by adding 1 to $(r-1)$'s complement.

Example: Find 10's complement of number if its 9's complement is 453299.

Solution: r's complement is $453299 + 1$

r's complement $= 453300$

Example :2's complement of 1010110 is**:**

Solution: 1's complement: complement each digit of number $(1010110) \rightarrow (0101001)_2$

Thus 2's complement is $0101001 + 1$

2's complement = $(0101010)2$

Another Method to Obtain 10's, 2's Complement:

Leaving all least significant 0's unchanged, subtracting the first non-zero least significant digit from 10 and subtracting all higher significant digits from 9.

Example: Find 10's complement of 012398.

Solution:

- Subtract 8 from 10 in the least significant position
- Subtracting all other digits from 9.

9999910

- 01239 8

98760 2

Thus 10's complement of 012398 is 987602.

Example: 10's complement of 246700.

Solution: Leaving 2 least significant 0's unchanged, subtracting 7 from 10 and other 3 digits from 9.

9991000 –246700 753300

Thus 10's complement of 246700 is 753300

Similarly 2's complement can be formed by leaving all least significant 0's and first 1 unchanged and replacing 1's with 0's and 0's with 1's in all other higher significant digits.

Example: 2's complement of $(1101100)_{2}$ **:**

Solution:

Thus 2's complement of 1101100 is $(0010100)_2$

Subtraction with complement:

i. Convert subtrahend N to r's complement.

ii. Then add to the minuend M.

- iii. If $M \ge N$, sum will produce end carry, which can be discarded, what is left is the result, $M N$.
- iv. If $M < N$, sum does not produce carry and is equal to $r^n (N M)$, which is same as r's complement of $(N M)$ $-M$).
- **v.** To take the answer in familiar form, take the r's complement of the sum and place a negative sign in front.

Example: Using 10's complement, subtract $72532 - 3250$

Discard end carry as M > N so result**:** 69282

Example: Using 10's complement, subtract 3250 – 72532

```
Solution: M = 3250
      N = 7253210's complement of 72532 is
               9999 10
             - 7253 2
10's complement 27468
Sum: 3250
      27468
Sum 30718
Since N > M so no end carry.
Therefore answer is – (10)'s complement of 30718) = –69282
```
Example: Subtract 1010100 – 1000011

Solution: 2's complement of N (1000011)=0111101

Sum**:** 1010100 + 0111101

10010001

So result is 0010001

Note: Subtraction can also be done using $(r - 1)$'s complement.

Signed Binary numbers

When binary number is signed, left most bit represents the sign and rest of bits represent the number.

- If binary number is unsigned, then left most bits is the most significant bit of the number.
- Positive or Negative can be represented by $(0 \text{ or } 1)$ bit which indicate the sign.

Example: String of bits 01001 can be considered as 9 (unsigned binary) or +9 (signed binary) because left most bits are 0.

Example: String of bits 11001 represent 25 when considered as unsigned number or – 9 when considered as signed number.

Negative number representation:

(i) **Signed magnitude representation:** In this representation number consist of a magnitude and a symbol $(+$ or -) or bit (0 or 1) indicating the sign, left most bit represents sign of a number.

 $11001 \rightarrow -9$

 $01001 \rightarrow +9$

(ii) **Signed complement system:**

• In this system, negative number is indicated by its complement.

• It can use either 1's or 2's complement, but 2's complement is most common.

Note:

- 2's complement of positive number remain number itself.
- In both signed magnitude & signed complement representation, the left most significant bit of negative numbers is always 1.

Example : $+9$ 00001001

 -9 11110111 (2's complement of +9)

Note: Signed complement of number can be obtained by taking 2's complement of positive number including the sign bit.

- Signed magnitude system is used in ordinary arithmetic, cannot employed in computer arithmetic because of separate handling of the sign and the magnitude.
- In computer arithmetic signed complement system is used to represent negative numbers.

Note:

2's complement representation range for n bit number is**:**

 2^{n-1} To 2^{n-1} -1 (for n = 8 range is + 127 \rightarrow - 128)

1's complement: $-(2^{n-1}-1)$ to $(2^{n-1}-1)$

Signed magnitude range: $-(2^{n-1}-1)$ to $(2^{n-1}-1)$

Binary Codes

Any discrete element of information distinct among a group of quantities can be represented with a binary code.

 \bullet n bit binary code is a group of n bits that have $2ⁿ$ distinct combinations of 1's and 0's with each combination representing one element of the set that is being coded.

Example: With 2 bits $2^2 = 4$ elements can be coded as: 00, 01, 10, 11

With 3 bits $2^3 = 8$ elements can be coded as:

000, 001, 010, 011, 100, 101, 110, 111

- Minimum number of bits required to code $2ⁿ$ distinct quantities in n.
- The bit combination of an n bit code is determined from the count in binary from 0 to $2^n 1$.
- **Example :** 3 bit combination
	- 000 0
	- 001 1
	- 010 2
	- 011 3
	- 100 4
	- 101 5
	- 110 6
	- 111 7

BCD (Binary coded decimal)

- A number with k decimal digits require 4 K bits in BCD.
- A decimal number in BCD is same as its equivalent binary number only when number is between 0 to 9.
- BCD number needs more bits that its equivalent binary.
- Example: $(185)_{10} = (000110000101)_{BCD} = (1011001)_2$
- In BCD number, each bit is represented by its equivalent binary representation.

Note: BCD numbers are decimal numbers and not binary numbers, although they use bits in their representation.

- Decimal are written as 0,1,2,3,…,9 which BCD can be written as **:** 0000, 0001, 0010, 0011, …, 1001 **Benefits of BCD:**
- BCD helps to do arithmetic operation directly on decimal numbers without converting them into equivalent binary numbers.

ELECTRONICS-ECE DIGITAL ELECTRONICS 12

BCD addition:

- If binary sum is equal to or less than 1001 (without a carry), the corresponding BCD digit is correct.
- If binary sum ≥ 1010 , the result is an invalid BCD.
- Addition of $6 = (0110)_2$ to the binary sum converts it to the correct digits and also produces a carry as required.

Example: Add 184 + 576 in BCD. **Solution:**

- Representation of Signed decimal numbers in BCD is similar to the representation of signed number in binary.
- Sign of decimal number is represented with 4 bits **:**

Positive number: '0000' (0)

Negative number – '1001' (9)
